

Leaks and Waterproofing

Foundation and Basement Waterproofing Solutions

Each year PERMA-DRY seals thousands of leaky basement foundations permanently in residential, commercial and industrial applications. Our waterproofing products have been proven effective in stopping all types of wet basement headaches and water leaks through concrete, masonry and even steel.

Our leak and waterproofing products include:

1. PERMA-SEAL® Flexible Resins Crack Repair
2. PERMA-DRAIN™ System for Hydrostatic Pressure Relief
3. PERMA-TRAC™ System for Water Infiltration Management
4. PERMA-PUMP™ System
5. RUB-R-KOTE™ Elastomeric Waterproofing Systems
6. DRY-COVE™ Air-Gap Membrane

PERMA-SEAL®

The PERMA-SEAL range of flexible resins provides

guaranteed repairs to cracked and leaking concrete foundations. When pressure-injected into a crack using THERMO-JET technology, these resins adhere to the concrete surface—even when it is wet—fill all voids and form a custom-fit seal throughout the entire thickness of a wall. The resins are durable and will withstand cracking and shifting as the result of thermal cycles. All repairs take place from the inside, with no need for digging, heavy equipment or disturbance to landscaping.

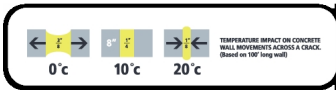

PERMA-SEAL is suitable for:

Conventional drain tile systems are

installed outdoors around the perimeter of a property. Installation can only take place during fine, dry weather and it requires extensive yardwork to repair landscaping, lawns and driveways. The PERMA-DRAIN solution is different. It is installed indoors, in any weather and in any season, around the entire perimeter of a foundation and carries water away from your building. Inspections, clear-outs and repairs can be carried out quickly and inexpensively—with no messy digging—and the system is guaranteed for as long as you own the property.

PERMA-TRAC™

The PERMA-TRAC system has been designed to tackle

the problem of hydrostatic pressure, which can build up outside your basement as a result of poor drainage. A proven and reliable water control system, it can help turn your basement into dry, usable space without the need for messy and disruptive excavation. Because it is installed from the inside, PERMA-TRAC can be put in place at any time of the year, in any weather conditions. Once installed, water infiltration through your floor and wall joints, floor cracks, poured concrete and cinder block walls is completely eliminated.

PERMA-PUMP™

Your sump pump is an important part of your

Waterproofing a basement is a complex task that requires a professional contractor. The most common method is to apply a waterproofing membrane to the exterior of the foundation walls. This membrane prevents water from entering the basement. Another method is to install a sump pump system. This system collects water that enters the basement and pumps it out to the exterior. Both methods are effective, but they must be installed correctly to ensure long-term protection.
